

AuTest

SMART AUTOMATED TESTING

Introducing Smart AuTest, the Automated Testing Solution that allows JDA/Blue Yonder (BY) users to automate their tests with full control. From stress testing to integration testing to performance testing, AuTest will prepare you for anything and everything that could happen in your warehouse.

AuTest is an application that frees JDA/Blue Yonder (BY) users from traditional manual testing, where one must create, manage and manipulate data after each test run. This application automates your JDA/BY testing process by allowing you to manage a single test or multiple tests in groups.

This application is most helpful for users who spend hours testing daily upkeep of their warehouse. Testers spend a lot of time to test each module individually and then, create and manage data each time any module is to be tested again.

AuTest simplifies this process for them by automating their entire testing process!

AuTest is equipped with the capability to efficiently perform stress tests and integration tests, giving you the peace of mind before any go-live. But it doesn't stop there, AuTest is also prepacked with most tests you will need to make sure your warehouse is running smoothly.

what's in it for Testers?

The AuTest Application provides new opportunities for JDA/BY users.

They can try various tests in a much shorter time than, the manual process provided by JDA/BY. Because AuTest comes configured with most tests needed for your day to day warehouse functionality, your time spent on testing is reduced significantly. This application lets you test and retest your system efficiently with minimal inputs from users and maximum outputs from the system. Testers get to spend less time inputting data and more time understanding their test results.

Features:

AuTest provides all the features, flexibilities and possibilities of testing. The best thing about Autest is that it utilizes JDA/BY components and customizations along with the application component to create, manage and run automated tests.

AuTest is capable of running any test scenario whether it is on the GUI or RF application. It comes not only with a quick and easy way to do stress and integration testing, but comes configured with tests for receiving, picking put-aways, shipping & much more.

Benefits:

Frees up time for users

Allows for quick JDA/BY solutions

Comes prepackaged with your day to day tests

Requires fewer people working on the same task

Faster client support

Can perform all tests including single, group and stress tests

Highly useable & scalable
