

Simplified Deployments

In the BY WMS, development and configuration have a remarkably close relationship. Managing all the changes that can impact production is a daunting task, requiring deep knowledge of the software's inner workings and data model. Our DevOps solution tracks all changes in the BY environment.

Features

- Ensures that all changes in the BY-WMS environment are tracked.
- Hides the complexity of the BY Data model from the developer or the functional user making the change to streamline the process.
- Implements a repeatable process to reduce manual export errors from users.
- Provides end-to-end management, from making the change to managing the data extraction, committing to a repository, and building a rollout.
- Offers visibility of the changes against the change identifier, for easy tracking and management.

Value Proposition

- One comprehensive toolset and methodology
- Works with industry-standard tools like JIRA, GIT, etc.
- Rollout Builder builds the rollout using standard BY methodology for easy deployment.
- Build a Rollout for the given change identifier or multiple ones based on a Sprint schedule.
- Supports REFS development.
- Tracks development, data, and configuration changes.
